CALIPSO

MICRO-DERMAL ABRASION WITH OXYGEN

Microdermabrasion is a non-invasive and painless dermocosmetic treatment that consists in the mechanical abrasion of the most superficial layers of the epidermis, obtained thanks to the diamond microspheres placed on the head of the handpiece.

Rejuvenates the face and corrects the irregularities of the skin, smoothes and eliminates the damaged outer layers by eliminating dead cells and also favoring cell renewal, obtaining a brighter and toned face.

It also stimulates the production of collagen and elastin that fight the relaxation and loss of skin tone.
